# Building PHP

## OpenSUSE

Ended up aborting this, but the notes might be handy for reference

```
# Install phpenv
curl -L https://raw.githubusercontent.com/phpenv/phpenv-installer/master/bin/phpenv-installer | bash

# setup opensuse tumbleweed, php compiling required packages
sudo zypper install -y -t pattern devel_basis
sudo zypper install -y libxml2-devel libxslt-devel openssl-devel sqlite3-devel libbz2-devel libcurl-devel libpng-
devel libjpeg-devel libicu-devel oniguruma-devel libtidy-devel libzip-devel

phpenv install 8.0.23
```

:(

## HomeBrew

For [php-version](#)

```
$ brew install php@7.3
$ php-version 7.3
```

## macOS PHPenv

For phpenv (untested and incomplete). Install phpenv first.

```
brew install openssl bzip2 libiconv
PHP_BUILD_CONFIGURE_OPTS="--with-openssl=$(brew --prefix openssl) --with-bz2=$(brew --prefix bzip2) --with-
iconv=$(brew --prefix libiconv)" phpenv install 8.0.26
```
