

PHP

- [Building PHP](#)

Building PHP

OpenSUSE

Ended up aborting this, but the notes might be handy for reference

```
# Install phpenv
curl -L https://raw.githubusercontent.com/phpenv/phpenv-installer/master/bin/phpenv-installer
| bash

# setup opensuse tumbleweed, php compiling required packages
sudo zypper install -y -t pattern devel_basis
sudo zypper install -y libxml2-devel libxslt-devel openssl-devel sqlite3-devel libbz2-devel
libcurl-devel libpng-devel libjpeg-devel libicu-devel oniguruma-devel libtidy-devel libzip-
devel

phpenv install 8.0.23
```

:(

HomeBrew

For [php-version](#)

```
$ brew install php@7.3
$ php-version 7.3
```

macOS PHPenv

For phpenv (untested and incomplete). Install phpenv first.
