

Move a site to a new domain

Move a site workflow:

1. Delete existing domain mappings for the site.
 2. `wp search replace $old_url $new_url --all-tables; wp cache flush`, avoiding trailing slashes.
 3. `wp rewrite flush --url=$new_url; wp rewrite flush;`
 4. Login to the network site, edit the site, press Save Changes. (not sure why)
 5. Verify site loads and login works.
 6. re-add domain.
 7. restart browsers because of cached redirects.
