Bookmarking

To prevent rethreading the same research paths, I'm documenting my bookmark journey.

I'm currently using <u>Firefox</u> across my devices and using it's inbuilt bookmark system.

Acceptance criteria

- 1. Bookmarks are searchable from the address bar, because that's where I do my searching.
- 2. Contents are archived to prevent link rot. Thanks to Archivor and <u>Web Archives</u>, I can search for any broken bookmark.
- 3. Bookmark contents are searchable (using Fafi).

Maintenance

I've added the following addons:

- 1. <u>Archivor</u> Sends all bookmarks to the internet archive so I can retrieve them if they get lost. This replaces many paid services.
- 2. <u>Bookmark Dupes</u> Easily remove duplicate bookmarks, for example after importing from another service, or after adding the bookmark multiple times. It is very fast as it seems to compare via hashing. I disable the addon after running.
- 3. <u>Bookmark Organiser</u> Correct redirections and remove broken bookmarks. Because of redirections it makes sense to run this one before Bookmark Dupes, but it is a lot slower as it visits every bookmark. I disable the addon after running.

Feedback welcome!
